ABSTRACT

The 2008 Nechako River Summer Water Temperature and Flow Management Project (the Project) was undertaken to attempt to prevent mean daily water temperatures in the Nechako River above the Stuart River confluence (at Finmoore) from exceeding 20.0°C (68.0°F) between July 20 and August 20. Water temperatures were managed by regulating Skins Lake Spillway releases to control flows in the Nechako River below Cheslatta Falls and at Vanderhoof. In 2008, mean daily water temperatures in the Nechako River above the Stuart River confluence did not exceed 20.0°C (68.0°F) between July 20 and August 20.

Over the duration of the 2008 Summer Water Temperature and Flow Management Project (July 10 to August 20), the total volume of water released was 7,529.3 m³/s-d, (265,897 cfs-d), and the average release during the Project was 179.3 m³/s (6,330.9 cfs).

INTRODUCTION

The Nechako River Summer Water Temperature and Flow Management Project (the Project) was designed and developed in 1982 and has been successfully implemented since 1983. Since 1988, water temperature and flow management projects (Triton 1995a through Triton 1995h; Triton 1996 through Triton 2006) have been carried out under the auspices of the Nechako Fisheries Conservation Program (NFCP).

The objective of the Project is to attempt to prevent mean daily water temperatures in the Nechako River above the Stuart River confluence (at Finmoore) from exceeding 20.0°C (68.0°F) by regulating releases from the Skins Lake Spillway to control flows in the Nechako River below Cheslatta Falls and at Vanderhoof. The Project operates from July 10 to August 20 (the operational period) with the goal of managing water temperatures in the Nechako River at Finmoore between July 20 and August 20 (the water temperature control period, hereafter referred to as the control period). These dates may vary as directed by the NFCP in accordance with the timing of sockeye runs in the system, but were followed in 2008. At the completion of the STMP, flows in the Nechako River at Cheslatta Falls are reduced to fall spawning flows by early September.

The Project study area is shown in Figure 1. Unless otherwise stated, references to water temperature, flow (including releases), and meteorological data are mean daily values. Note that water temperature measurements for the Nechako River above the Stuart River confluence are made at Finmoore (the closest readily accessible location) while river discharge measurements are made at Vanderhoof (at the Water Survey of Canada discharge measuring site).

This report reviews the 2008 Summer Water Temperature and Flow Management Project and includes:

- An outline of the method for determining Skins Lake Spillway releases and summaries of the 2008 Skins Lake Spillway releases for the period July 10 to August 20 inclusive;
- Recorded flows and water temperatures (July 10 to August 20) at various locations along the Nechako River; and,
- The volume of cooling water used in the 2008 Summer Water Temperature and Flow Management Project.

Nechako Fisheries Conservation Program Map # RM99-1-11

FIGURE 1. NECHAKO RIVER STUDY AREA

METHODS

Management of the Nechako River flows and water temperatures used water temperature predictions based on five-day meteorological forecasts prepared by the commercial forecasting division of Pelmorex Inc. (The Weather Network) to determine the schedule of Skins Lake Spillway releases required to meet project objectives. The Summer Water Temperature and Flow Management uses an unsteady-state flow routing model and an unsteady-state water temperature prediction model designed to compute daily flows and water temperatures in the Nechako River during the entire operational period (Envirocon Limited, 1984a,b,c and 1985).

Daily operations followed the protocol defined in the Settlement Agreement (Anon. 1987), and involved collection of water temperature and river stage data from several locations in the study area, as well as development of five-day meteorological forecasts.

Water temperatures were obtained daily from temperature loggers maintained in the Nechako River below Cheslatta Falls (at Bert Irvine's Lodge), in the Nechako River at Fort Fraser (upstream of the Nautley River), in the Nechako River above the Stuart River confluence, and in the Nautley River. Water temperature data for the Nechako River below Cheslatta Falls and the Nautley River were provided by Water Survey of Canada. Following failure in 2007 of the Weksler thermographs used in prior years, water temperature data in the Nechako River at Fort Fraser and in the Nechako River above the Stuart River confluence were obtained using HOBO U12 Outdoor/Industrial Data loggers (listed accuracy of $\pm 0.25^{\circ}\text{C}$). In addition, spot temperatures measured with a calibrated mercury thermometer ($\pm 0.1^{\circ}\text{C}$) and corresponding recorded water temperatures were collected daily in the Nechako River at Fort Fraser and in the Nechako River above the

Stuart River confluence. The spot data enabled an ongoing check of the HOBO data loggers.

River stages were obtained daily from Water Survey of Canada recorders maintained in the Nechako River below Cheslatta Falls, in the Nechako River at Vanderhoof, and in the Nautley River, and provided via a daily e-mail from Environment Canada (Water Survey of Canada, WSC). Five-day meteorological forecasts were e-mailed daily by World Weatherwatch (Pelmorex Inc. www.theweathernetwork.com).

Water levels recorded hourly by WSC in Cheslatta Lake at West End were also obtained (via daily e-mail from Environment Canada) from the station's data collection platform. These lake level data were used to assist in the analysis of daily predictions of flow produced by the flow routing model for the Nechako River below Cheslatta Falls, and to account for local inflow to the Cheslatta/Murray Lakes system.

The first 10 days of the operational period, July 10 to July 19, were utilized for system start up, for initialization of the database required to schedule Skins Lake Spillway releases, and to increase flows in the Nechako River from spring flows to the minimum cooling flow of $170 \text{ m}^3/\text{s}$ (6,000 cfs) below Cheslatta Falls. The 2008 Skins Lake Spillway spring base release as directed by the NFCP was $49.0 \text{ m}^3/\text{s}$ (1,730 cfs). Upon commencement of the operational period on July 10, the recorded flow in the Nechako River below Cheslatta Falls was $50.1 \text{ m}^3/\text{s}$ (1,769 cfs). The Skins Lake Spillway was increased to $136 \text{ m}^3/\text{s}$ (4,802 cfs) on July 11, to $223 \text{ m}^3/\text{s}$ (7,875 cfs) on July 14, to $283 \text{ m}^3/\text{s}$ (10,000 cfs) on July 16, and was decreased to $170 \text{ m}^3/\text{s}$ (6,000 cfs) on July 19 to ensure flows in the Nechako River below Cheslatta Falls reached the minimum cooling flow of $170 \text{ m}^3/\text{s}$ (6,000 cfs) by July 20 (the beginning of the water temperature control period).

—→ observed trend

- · - · → predicted trend

- - - → forecast trend

* The current day (i.e., the day of operation) for this example is July 16.

Throughout the operational period, water temperatures in the Nechako River were calculated daily for the previous day, the current day, and each of the next four days using the unsteady-state flow routing and water temperature prediction models. These calculations were based on recorded and five-day forecast meteorological data, recorded water temperature, and computed flow data. Forecast water temperature predictions were tabulated and reviewed daily to identify trends in water temperature changes. These trends are the same as those used in the water temperature and flow management projects since 1984 (Envirocon Ltd. 1985), and are best explained through reference to Table 1.

Assuming the current day is July 16, entries corresponding to the current day's operation are represented by the letter *c*. Entries *co* and *cs* represent the recorded and calculated water temperatures, respectively, for the previous day (July 15). Entries *c1* through *c5* represent predicted water temperatures computed using the current day's five-day meteorological forecast and an assumed current day's flow regime. The entry *rc* represents the current day Skins Lake Spillway release required to meet Project objectives.

The following three trends in water temperature changes were reviewed on a day-by-day basis:

1. Observed trend - developed from recorded mean daily water temperatures measured in the Nechako River above the Stuart River confluence each day (*bo* and *co* in Table 1). The difference in recorded water temperatures for the previous two days is extrapolated over the next five days to determine the observed water temperature trend.
2. Predicted trend - developed from the predicted water temperatures for the previous day and the following five

days (*cs*, *c1*, *c2*, *c3*, *c4*, *c5*, in Table 1). These data represent the predicted trend.

3. Forecast trend - developed from the difference between the current five-day and previous five-day predictions for the same calendar days (*c3* and *b4*, *c2* and *b3*, *c1* and *b2* in Table 1). Differences between forecasted data on coincident dates for the current day and the next two days only are averaged and added to the fifth day predicted temperature to determine the trend in forecasted temperatures.

A numerical example of how the trends are calculated is presented in Appendix A.

Each day predicted water temperatures for the five-day forecast period were checked and the three trends calculated. If two of the three trends indicated that the water temperature in the Nechako River above the Stuart River confluence could potentially exceed 19.4°C (67.0°F) then an increase in the Skins Lake Spillway release was required. When this occurred the current day's release was revised and the flow and temperature models were rerun using the modified flow regime. Results of each day's final computer run were subsequently used to initialize water temperatures for the following day's computations. Entries in Table 1 represent each day's final cooling water release and resultant predicted water temperatures.

The following release criteria were used with the three trends identified above to determine the timing and magnitude of Skins Lake Spillway releases:

1. When two of the three trends show an increase in water temperature in the Nechako River above the Stuart River confluence, and these trends show that potentially the water temperature could exceed 19.4°C (67.0°F), increase the

Skins Lake Spillway release according to criteria 2 and 3 below.

2. Operate Skins Lake Spillway such that flow in the Nechako River below Cheslatta Falls ranges between 170 m³/s (6,000 cfs) and 283 m³/s (10,000 cfs) as required, and flow in the Nechako River above the Stuart River confluence (as measured at Vanderhoof) does not exceed 340 m³/s (12,000 cfs). It is understood that the flow in the Nechako River below Cheslatta Falls is to be not less than 170 m³/s (6,000 cfs) by the beginning of the control period, and is to be reduced to approximately 31.2 m³/s (1,100 cfs) by September 6.
3. At any time, increase the Skins Lake Spillway release from the current level to 453 m³/s (16,000 cfs) to achieve the flow changes in the Nechako River as quickly as possible.
4. During cooling periods when two of three trends in forecasted water temperatures are decreasing and these trends indicate that potentially the water temperature could drop below 19.4°C (67.0°F) within the forecast period (five days), reduce the Skins Lake Spillway release from the current level to 14.2 m³/s (500 cfs).

RESULTS

Predicted and recorded mean daily water temperatures for the Nechako River above the Stuart River confluence, Skins Lake Spillway releases, and changes in Skins Lake Spillway releases over the duration of the Project operational period are summarized in Table 2.

Recorded mean daily water temperatures in the Nechako River above the Stuart River confluence (Figure 2 and Table 3) did not exceed 20.0°C (68.0°F). The respective

maximum and minimum mean daily water temperatures recorded during the control period were 19.5°C (67.1°F) on August 16 and 17, and 15.7°C (60.3°F) on July 31, 2008. Mean daily water temperatures in the Nechako River below Cheslatta Falls, near Fort Fraser and above the Stuart River confluence, and in the Nautley River near Fort Fraser are presented in Appendix B.

Skins Lake Spillway releases and their corresponding flows in the Nechako River below Cheslatta Falls and at Vanderhoof are plotted in Figure 3 (source data are provided in Appendix C). Changes in Skins Lake Spillway releases during the STMP were made on the following dates:

1. July 11 - Increase to 136 m³/s - to increase flow in Nechako River below Cheslatta Falls to STMP base flow by July 20.
2. July 14 - Increase to 223 m³/s - to increase flow in Nechako River below Cheslatta Falls to STMP base flow by July 20.
3. July 16 - Increase to 283 m³/s - to increase flow in Nechako River below Cheslatta Falls to STMP base flow by July 20.
4. July 19 - Decrease to 170 m³/s - to ensure flow in Nechako River below Cheslatta Falls is maintained at summer base flow.
5. July 22 - Increase to 453 m³/s - to increase flow in Nechako River below Cheslatta Falls in response to warming trend.
6. July 23 - Decrease to 14.2 m³/s - to decrease flow in Nechako River below Cheslatta Falls in response to cooling trend.
7. July 24 - Increase to 170 m³/s - to ensure flow in Nechako River below Cheslatta Falls is maintained at summer base flow
8. August 13 - Increase to 453 m³/s - to increase flow in Nechako River below

Cheslatta Falls in response to warming trend.

9. August 16 - Decrease to 283 m³/s - to limit flow in Nechako River below Cheslatta Falls to maximum or 283 m³/s.
10. August 17 - Decrease to 14.2 m³/s - to ensure flow in Nechako River below Cheslatta Falls is maintained at fall spawning flow.

During the control period, measured flows in the Nechako River below Cheslatta Falls (based on preliminary WSC data from the WSC data collection platform at Bert Irvine's Lodge) ranged between a maximum of 291.5 m³/s (10,291 cfs) on August 17 and a minimum of 161.4 m³/s (5,700 cfs) on August 6. Flows measured in the Nechako River at Vanderhoof ranged between a maximum of 314.8 m³/s (11,114 cfs) on August 19 and a minimum of 176 m³/s (6,209 cfs) on July 20.

DISCUSSION

The discussion of the 2008 Summer Water Temperature and Flow Management Project has been divided into three sections. The first section reviews the collection and use of recorded field data, including water temperature, flow, and meteorological data (recorded and forecast). The second section discusses the volume of water used during the 2008 Summer Water Temperature and Flow Management Project. The third section provides a brief discussion of the application of the Project release criteria.

Recorded Data

The modelling procedure was initialized using recorded conditions. The quality of the field data used in the modelling process directly affects the accuracy of the computed water temperatures. Therefore, data must be collected accurately and consistently to ensure that random errors are kept to a minimum. Further, consistency in data collection techniques also

ensures that, if a bias exists in the data, it remains relatively constant throughout the project.

In 2008, river discharges in the Nechako River below Cheslatta Falls and at Vanderhoof as recorded by the Water Survey of Canada changed as expected in response to Skins Lake Spillway releases (Figure 3). The hourly stage data from the gauging stations located on the Nechako River below Cheslatta Falls and at the west end of Cheslatta Lake proved very useful in verifying the daily predictions of the flow routing model and to account for changes in the local inflow to the Cheslatta/Murray Lakes system.

As previously stated, spot and corresponding data logger water temperatures were collected in the Nechako River at Fort Fraser and in the Nechako River above the Stuart River confluence during each site visit. The logger water temperatures were comparable to their associated spot temperatures.

Volume of Water Used

The recorded flows in the Nechako River below Cheslatta Falls for the 2008 Summer Water Temperature and Flow Management Project are shown in Figure 4. Also indicated is the minimum cooling flow of 170 m³/s (6,000 cfs) in the Nechako River below Cheslatta Falls, and the Skins Lake Spillway spring base release of 49.0 m³/s (1,730 cfs) as determined by the NFCP Technical Committee as part of the "Annual Water Allocation" defined in the 1987 Settlement Agreement (Anon. 1987).

The total volume of water released during the 2008 Summer Water Temperature and Flow Management Project operational period was 7,529.3 m³/s-d, (265,897 cfs-d). The volume released for cooling purposes was 5,610.7 m³/s-d (198,140 cfs-d), and is based on an assumed Skins Lake Spillway release of 49.0 m³/s (1,730 cfs) for the period July 10 to August 16, inclusive, with a reduction to 14.2 m³/s (500 cfs)

**Figure 2: Recorded Mean Daily Temperatures in the Nechako River above the Stuart River Confluence
July 10 to August 20, 2008**

Figure 3: Skins Lake Spillway Releases and Flows in the Nechako River below Cheslatta Falls and at Vanderhoof
 July 10 to September 6, 2008

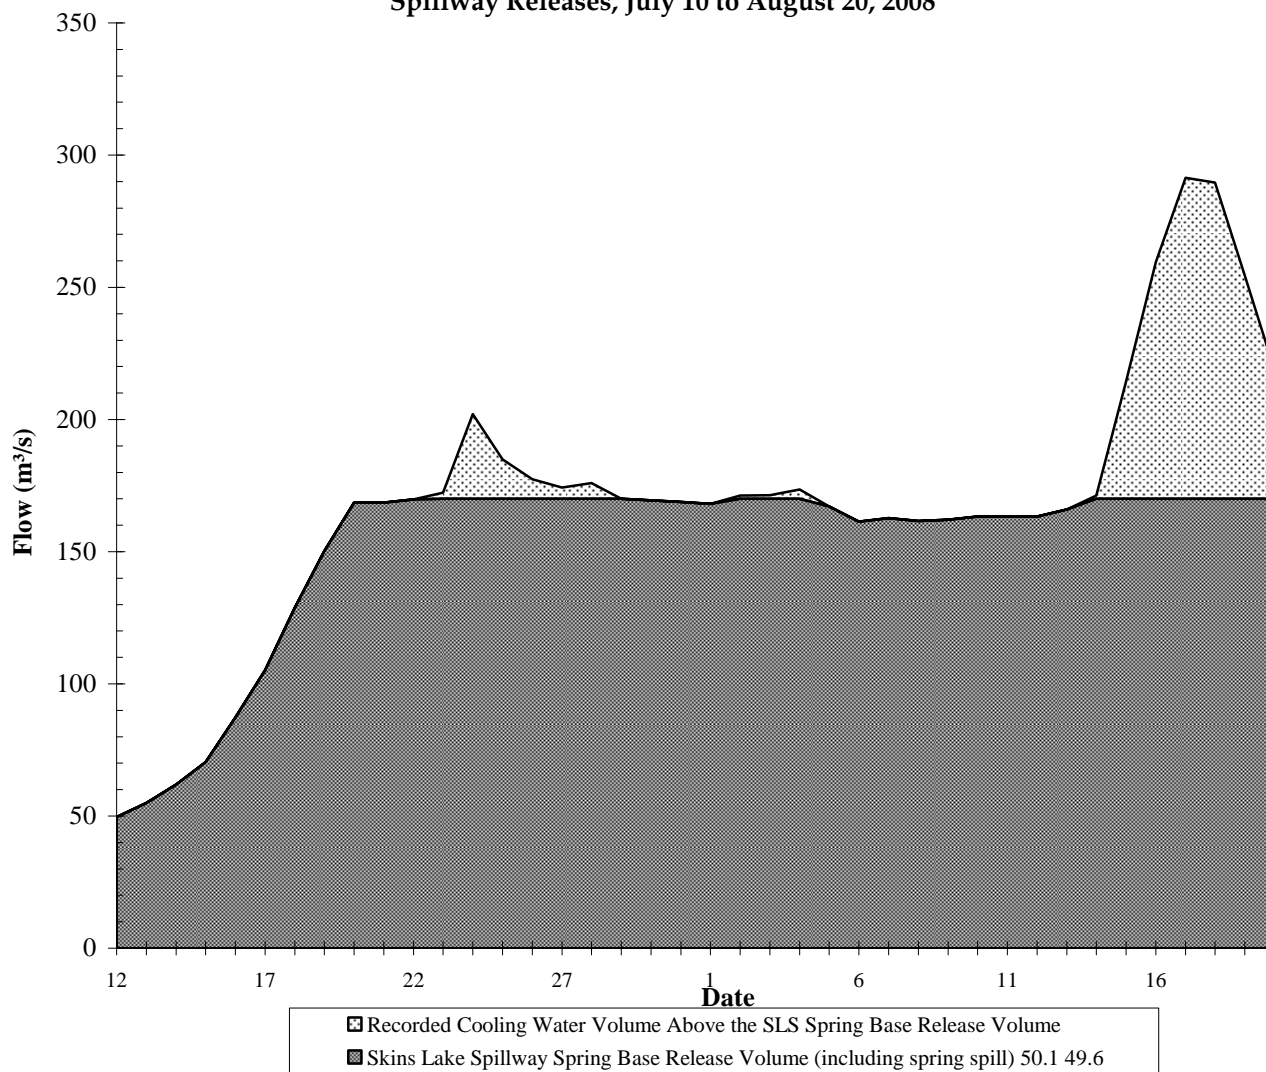

Figure 4: Flows in the Nechako River below Cheslatta Falls Resulting from Skins Lake Spillway Releases, July 10 to August 20, 2008

until August 20. The average release during the operational period was 179.3 m³/s (6,330.9 cfs). Volume calculations are presented in Appendix E.

Application of the Summer Water Temperature and Flow Management Project Release Criteria

The Summer Water Temperature and Flow Management Project is very sensitive to the accuracy of meteorological forecasting. If an increase or decrease in temperature occurs over a prolonged period of time (three or four days),

inaccurate meteorological forecasts may predict the reversal of the temperature change prematurely. In these instances, it may be required to exercise judgment when applying the Summer Water Temperature and Flow Management Project release criteria used with the three water temperature trends. This judgment is based on experience gained in the operation of the Summer Water Temperature and Flow Management Project since 1984 and may result in exceptions to the decision based on strict adherence to the release criteria. Exceptions were made to the application of the

release criteria during the 2008 operational period.

On August 14, 2008, one of three water temperature trends indicated that the water temperature could reach 21.8°C (71.3°F) in the Nechako River above Stuart River within the forecast period (5 days). The remaining two trends showed that the water temperature could hit 19.3°C (66.8°F) and 19.4°C (66.9°F). Following the release criteria under these conditions, the release from Skins Lake Spillway should have been decreased from the current release of 453 m³/s (16,000 cfs) to 14 m³/s (500 cfs). However, there was no strong indication of a strong cooling trend forming. Therefore, as a conservative measure, it was decided to maintain the spillway release at 453 m³/s (16,000 cfs) until a cooling trend was clearly established on August 16.

SUMMARY

The 2008 Nechako River Summer Water Temperature and Flow Management Project (the Project) was undertaken to attempt to prevent mean daily water temperatures in the Nechako River above the Stuart River confluence (at Finmoore) from exceeding 20.0°C (68.0°F) between July 20 and August 20. Water temperatures were managed by regulating Skins Lake Spillway releases to control flows in the Nechako River below Cheslatta Falls and at Vanderhoof. In 2008, mean daily water temperatures in the Nechako River above the Stuart River confluence did not exceed 20.0°C (68.0°F) between July 20 and August 20.

APPENDIX A

Numerical Example of Water Temperature Trend Calculation

Appendix A

Numerical Example of Water Temperature Trend Calculation

From data for July 16 date of operation (Table A1).

1. Observed Trend

The observed trend is down by 0.1°C from 17.7°C (J14) to 17.6°C (J15). Take the previous day's recorded temperature 17.6°C (J15) and extrapolate the trend for five days at -0.1°C . The observed trend shows that the water temperature could potentially reach $17.7^{\circ}\text{C} + 5(-0.1^{\circ}\text{C}) = 17.2^{\circ}\text{C}$.

2. Predicted Trend

The predicted trend is the difference between the previous day's calculated water temperature (J15) and the fifth day predicted water temperature (J20). The predicted trend is up from 17.6°C to 19.1°C with the potential to reach 19.1°C .

3. Forecast Trend

The forecast trend for the current day of July 16 is based on the first, second and third day forecasts.

| | | | | |
|---------|--------------|---|----|-----------------------|
| July 16 | 17.8 to 18.3 | = | up | 0.5°C |
| July 17 | 18.0 to 18.8 | = | up | 0.8°C |
| July 18 | 18.4 to 18.9 | = | up | 0.5°C |

Mean of 3 differences = up 0.6°C

This mean of 0.6°C is added to the fifth day predicted water temperature to give $19.1^{\circ}\text{C} + (0.6^{\circ}\text{C}) = 19.7^{\circ}\text{C}$.

WORLD WEATHERWATCH FORECAST ISSUED AUG 19/08

APPENDIX E

**Summer Water Temperature and Flow Management Project Reservoir Release
Volume Calculations for July 10 to August 20, 2008**

Appendix E

Summer Water Temperature and Flow Management Project Reservoir Release Volume Calculations for July 10 to August 20, 2008

Skins Lake Spillway base release for the period July 10 (192) to August 20 (233) = 49.0 m³/s

Summer Water Temperature and Flow Management Project Base Release Volume

$$= (JD\ 229 - JD\ 191) * 49.0 + (JD\ 233 - JD\ 229) * 14.16 = 1,918.6\ m^3/s*days$$

| Time period (Julian Day) | Time (hrs) | Flow Rate (m ³ /s) | Volume (m ³ /s*hrs) |
|--|----------------------|----------------------------------|-----------------------------------|
| July 10 (192) @ 2400 hrs to July 11 (193) @ 1100 hrs | 35.0 | 49.0 | 1,715 |
| July 11 (193) @ 1100 hrs to July 14 (196) @ 0800 hrs | 69.0 | 136.0 | 9,384 |
| July 14 (196) @ 0800 hrs to July 16 (198) @ 1600 hrs | 56.0 | 223.0 | 12,488 |
| July 16 (198) @ 1600 hrs to July 19 (201) @ 1000 hrs | 66.0 | 283.0 | 18,678 |
| July 19 (201) @ 1000 hrs to July 22 (204) @ 1900 hrs | 81.0 | 170.0 | 13,770 |
| July 22 (204) @ 1900 hrs to July 23 (205) @ 1400 hrs | 19.0 | 453.0 | 8,607 |
| July 23 (205) @ 1400 hrs to July 24 (206) @ 1600 hrs | 26.0 | 14.2 | 368 |
| July 24 (206) @ 1600 hrs to August 13 (226) @ 1600 hrs | 480.0 | 170.0 | 81,600 |
| August 13 (226) @ 1600 hrs to August 16 (229) @ 1600 hrs | 72.0 | 453.0 | 32,616 |
| August 16 (229) @ 1600 hrs to August 17 (230) @ 1600 hrs | 24.0 | 14.2 | 341 |
| August 17 (230) @ 1600 hrs to August 20 (233) @ 2400 hrs | 80.0 | 14.2 | 1,136 |
| Total | 1,008 (42.0 days) | | 180,703 |

Total Release Volume

$$= 180,703\ m^3/s*hrs$$

$$= 7,529.3\ m^3/s*days$$

$$= 265,897\ cfs*days$$

Volume Released for Cooling Purposes

$$= \text{Total Volume} - \text{Base Volume}$$

$$= 7,529.3 - 1,918.6$$

$$= 5,610.7\ m^3/s*days$$

$$= 198,140\ cfs*days$$

Average Release over Summer Management Period
(July 10 to August 20)

$$= 7,529.3\ m^3/s*days / 42\ days$$

$$= 179.3\ m^3/s$$

$$= 6,330.9\ cfs$$
